PRIVATE KNOWLEDGE · PERMISSION-AWARE AI

Useful answers. *Guarded knowledge.*

OpenVault helps teams find answers in company documents without widening access to the files behind them.

- Launch-ready
- Preparing first-user rollout

ACCESS IS THE HARD PART

A useful answer shouldn't *cost someone their privacy.*

Organizations need knowledge to be searchable, but internal files carry different permissions, owners, and levels of sensitivity.

01 / FRAGMENTED

Knowledge is scattered.

Policies, procedures, contracts, and team knowledge live across folders and documents.

02 / ACCESS DRIFT

Search can cross a boundary.

A shared index or generic assistant can expose material beyond the requester's permissions if access isn't enforced during retrieval.

03 / LOW TRUST

Answers need evidence.

Teams need to verify where an answer came from and administrators need a record of what happened.

The product opportunity: AI search that respects the same audience rules as the source documents.

PERMISSION-AWARE RETRIEVAL

The permission check happens *before the model sees evidence.*

OpenVault brings document access, cited AI answers, sharing controls, and audit into one company workspace.

01

Company documents

Upload policies, procedures, contracts, and other internal files.

02

Identity + scope

Resolve the organization, user, department, and document grants.

03

Permission filter

Only authorized passages enter the evidence set for retrieval.

04

Configured model

Use a managed provider or a locally run model, according to policy.

05

Cited response

Return an answer with sources and retain an auditable product trail.

EXAMPLE ANSWER

“Travel expenses require manager approval before booking.”

Travel policy · p. 4 · accessible to this user

ADMINISTRATOR CONTROLS

Company-wide, department, named-person, and one-to-one sharing scopes; revocation and audit events.

KNOWLEDGE-INTENSIVE TEAMS

Start with organizations *where access matters.*

A focused launch market lets OpenVault validate document workflows and permission boundaries before broadening its reach.

INITIAL TARGET PROFILE

- Small and mid-sized organizations with sensitive internal knowledge.
- Administrators who need controlled access and a reviewable audit trail.
- Teams that want useful AI answers without turning every shared drive into a public knowledge base.

FINANCE

Policies + evidence

Find rules and supporting sources for everyday work.

LEGAL

Contracts + playbooks

Keep matter-specific material scoped to the right people.

PEOPLE OPERATIONS

Policies + procedures

Separate company guidance from restricted personnel files.

CONSULTING / OPERATIONS

Repeatable knowledge

Answer questions from controlled project documentation.

Business model: organization subscription tiers, with enterprise options for custom deployment and AI-provider requirements.

BUILT AROUND THE BOUNDARY

The model should know no more than the person asking.

OpenVault treats authorization as part of retrieval—not as a warning shown after the answer is generated.

01

Access before retrieval

Restricted passages are filtered before context is assembled.

02

Tenant separation

Organizations have distinct memberships, documents, and policies.

03

Answers with sources

Citations make it easier to inspect and verify an answer.

04

Model choice

Support for managed cloud providers and local inference paths.

Search that merely finds a document

Retrieval governed by who can read it

FROM DEVELOPMENT TO FIRST USERS

Core product built. *Launch is next.*

OpenVault is preparing its first-user rollout. This deck presents plans and product capabilities, not unverified customer or revenue metrics.

DEVELOPMENT SUPPORT

$1,000

AWS Activate credits received and used toward product development.

Founder-led Pre-launch

BUILT

Core workflow

Multi-tenant workspaces, document ingestion, access scopes, cited answers, controlled sharing, and audit history.

NOW

Launch preparation

Stabilize the online service, validate permissions and recovery, and prepare onboarding for early organizations.

NEXT

Measure before scaling

Track reliability, model usage, and cost per workspace; expand infrastructure only as real usage grows.

AI today: the platform supports Amazon Bedrock and local-model paths. NVIDIA NIM is a proposed pilot—not a deployed integration.

PLANNED PILOT · NOT YET DEPLOYED

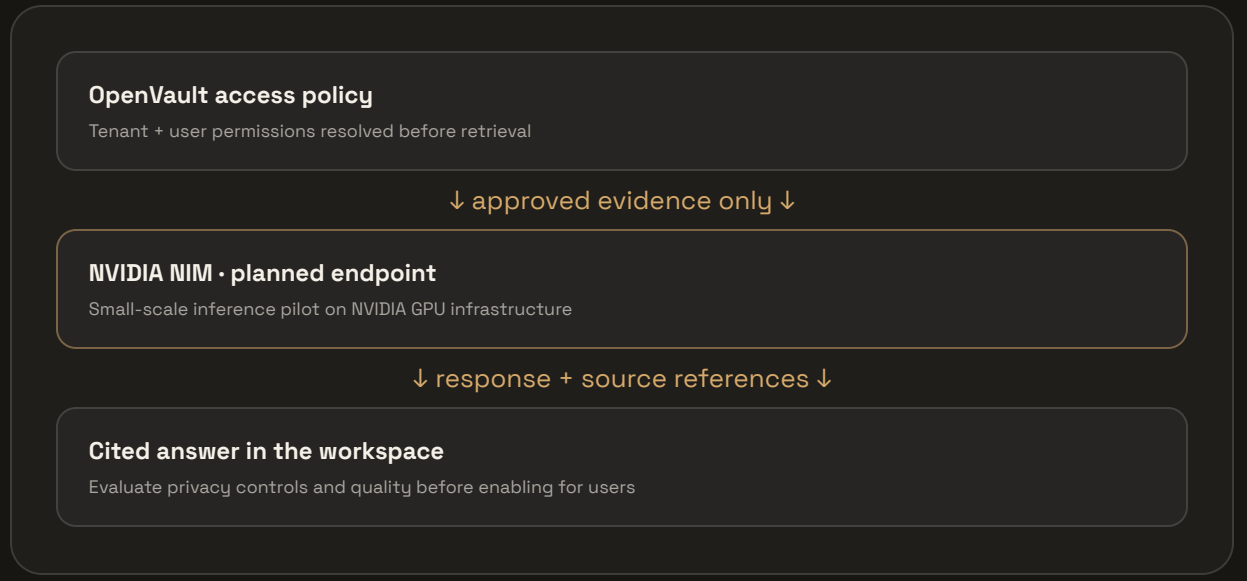

Private inference, *on the customer's terms.*

Evaluate NVIDIA NIM as an opt-in model endpoint for organizations that require customer-controlled inference alongside managed Bedrock.

1 **Connect through a provider adapter**
Add a compatible NIM endpoint to OpenVault's existing model-provider boundary.

2 **Run a small, isolated GPU pilot**
Use test documents and an opt-in customer-controlled environment first.

3 **Measure, then decide**
Evaluate answer quality, latency, cost, access isolation, and operational complexity before production use.

TODAY

Bedrock and local-model provider paths are supported in the product.

NVIDIA

NIM integration and GPU pilot are planned; not represented as current usage.

LAUNCH CAREFULLY · LEARN QUICKLY

A measured path from *first users to private AI options.*

0–30 DAYS

Launch baseline

Prepare the online service, onboard early organizations, and validate document access and restore flows.

30–60 DAYS

Run NVIDIA pilot

Build and test the NIM adapter in an isolated environment; measure cost, latency, and quality.

60–90 DAYS

Adopt only what works

Review results and user needs; keep NIM optional unless the pilot meets security and operating goals.

What we seek from Inception

Technical guidance and ecosystem resources to validate a real NVIDIA inference use case. If eligible, guidance on NVIDIA's AWS Activate Provider route and Org ID.

How we will measure progress

Permission-isolation tests, answer quality, latency, model cost per workspace, and successful early-user onboarding—reported only when verified.
